While it is known in the art to provide a first plate; a second plate defining a aperture; a screen element sandwiched between the top and bottom plates, and characterised in that the screen element is retained between the first and second plates by means of a rod extending through the interior of the screen element and through the aperture in the second plate with the second plate being retained on the rod by means of a removable retaining means (see, for example, US 5,985,142 to Belden), in the examiner's opinion, the prior art fails to teach or render obvious the apparatus being configured as a screen nozzle for a media retention screen including a means for attaching the screen nozzle to the media retention screen or the screen nozzle over each opening in the media retention screen.
